## DWA\_08 Discussion Questions

In this module you will continue with your "Book Connect" codebase, and further iterate on your abstractions. You will be required to create an encapsulated abstraction of the book preview by means of a single factory function. If you are up for it you can also encapsulate other aspects of the app into their own abstractions.

To prepare for your session with your coach, please answer the following questions. Then download this document as a PDF and include it in the repository with your code.

1. What parts of encapsulating your logic were easy?

The easiest part was the structure and the core logic. I also applied a if null function that checks if the html element that we are using is actually an html element or is just equal to null which was quite easy to add.

\_\_\_\_\_

2. What parts of encapsulating your logic were hard?

The hardest part was actually implementing the code because i struggled to get the event object to work, however i figured it out by just removing the () from the function in the addEventListener it will so it looks like eventlistener ('click', object.function) Figuring out what i want the user to interact with.

3. Is abstracting the book preview a good or bad idea? Why? I think it is a good idea if you keep the encapsulation small because if you make it too big it could break your logic could go for example, keeping the active separate from the rest of the code can lead to unnecessary work that would not improve the use of it,

however the fact you can control all the the features of the preview book that are necessary like closing the modal for example.
